Impulse Response Collection

VISIONARY ROBOTS INDUSTRIES

StomplR - Pack 2

User manual

Thank you so much for purchasing our first IR collection!

This manual will guide you through the process of installing the Logic ProX's Space Designer presets. It is really simple. Let's get started!

The stomps

We professionally sampled two stomps, one of them (the Muza FD900) out of production:

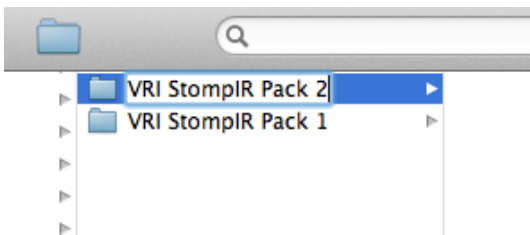

- Marshall Reflector
- Muza FD900

The recordings were made at 48KHz and 24 bit resolution, so you're good to go with cinematic reverbs.

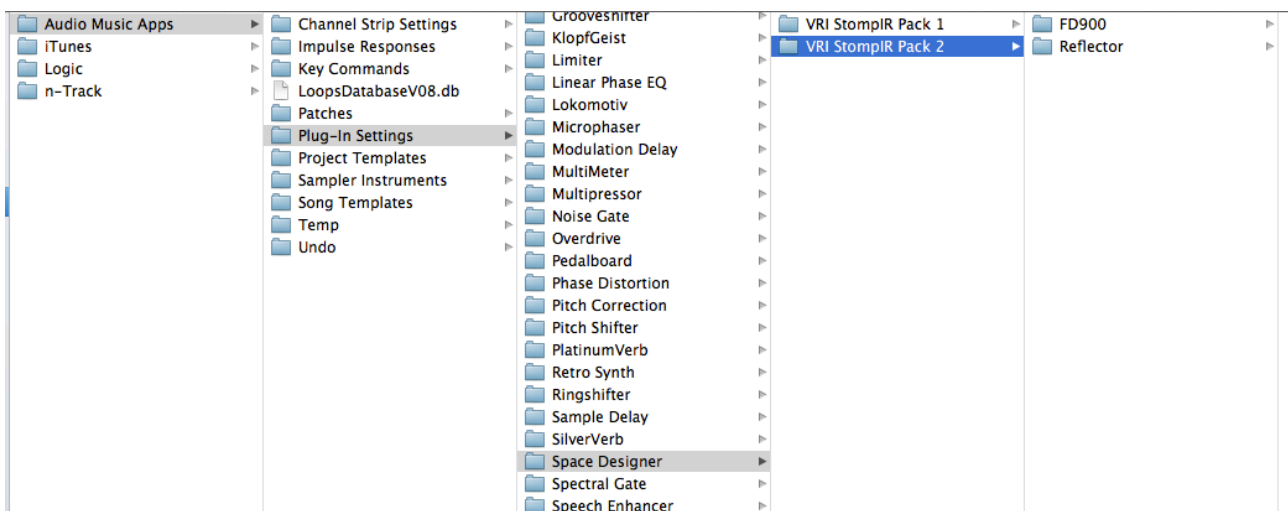

There are 68 IRs in the pack, and you have .wav files for maximum compatibility with any free and commercial IR player and/or reverb! But there also the IRs and presets for Logic ProX's Space Designer reverb. Plus there is a Reason Refill for the RV-7000 MkII reverb.

Installing the Space Designer presets

To install the presets the only thing you need to do is to place the "VRI stomplR Pack 2" folder into your /Music/Audio Music Apps/Plug-In Settings/Space Designer" folder. First create a new folder and name it "VRI StomplR Pack 2":

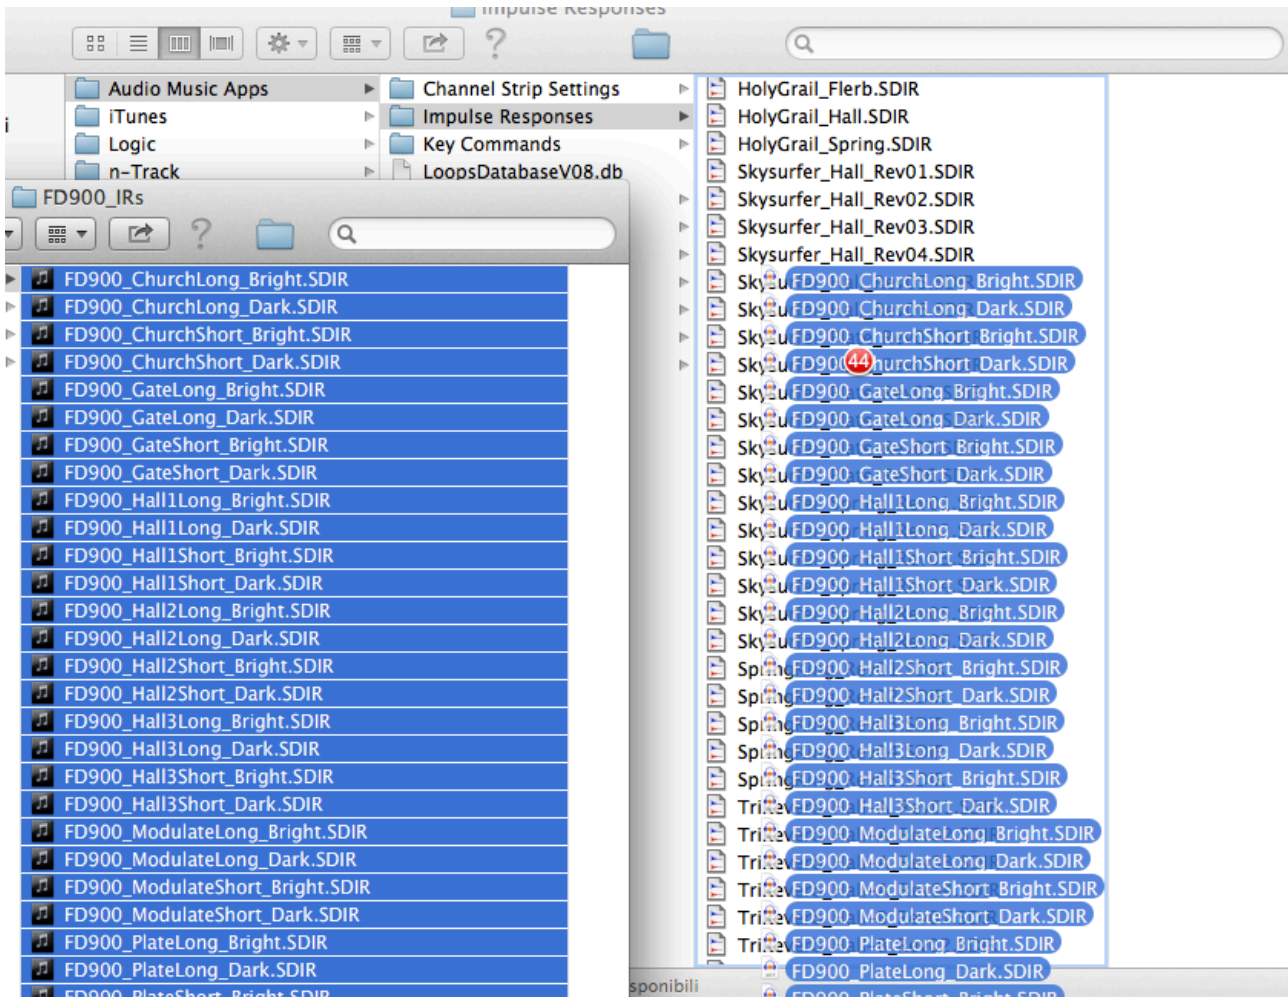

Then copy the two "FD900_SpaceDesigner_Preserts" and "Reflector_SpaceDesigner_Preset" folders into the previously created folder and change their name into "FD900" and "Reflector" respectively:

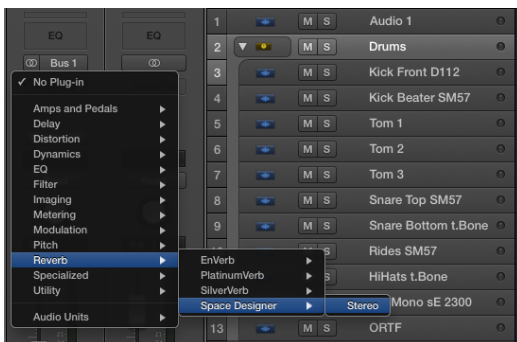

Now Space Designer will automatically create the menu item with all the presets inside it. But before it will work we need to install the actual IR files into the right folder, otherwise Space Designer will not be able to properly load the presets.

Installing the IRs for Space Designer

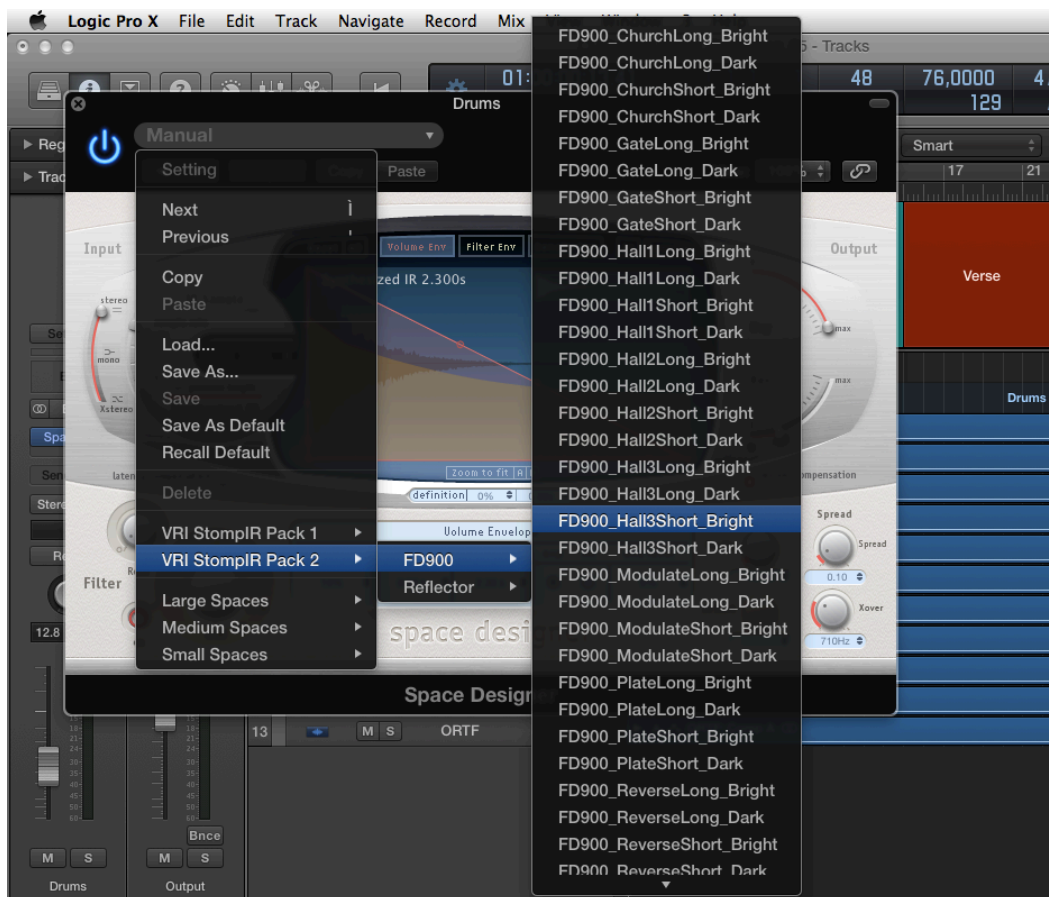

Again, this is a really simple operation. Just copy the “FD900_IRs” and “Reflector_IRs” folders’ content into your “Audio Music Apps -> Impulse Responses” folder:

If a folder named “Impulse Responses” is not already present in your “Audio Music Apps” folder, just create one and go ahead with the copy process. And that’s it, you’re good to go! Now you can open Logic and load the presets into Space Designer. Open your current project, select Space Designer for the track you want to add a reverb:

Now from the plugin window menu choose your favorite StompIR preset:

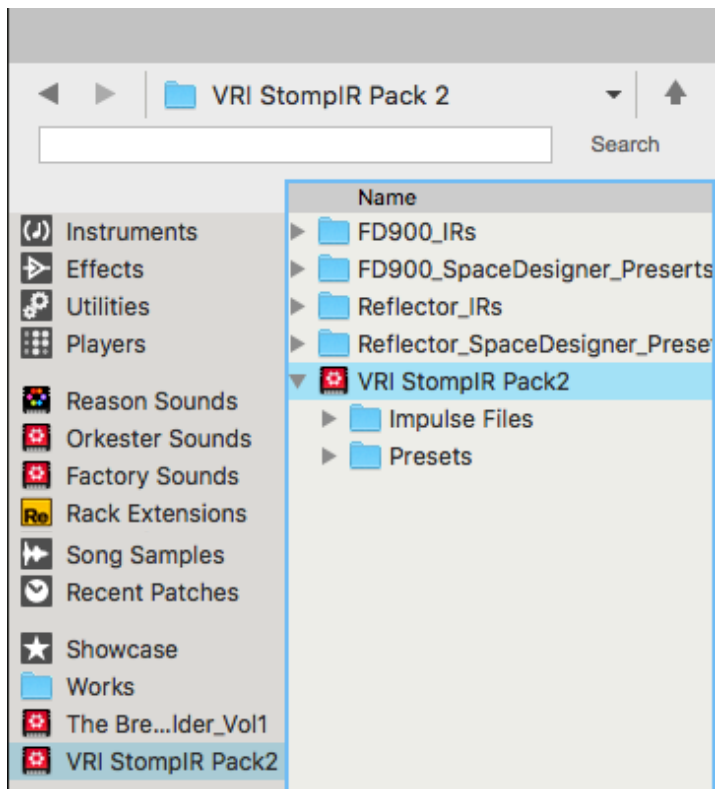

Installing the IRs for Reason's RV-7000 MkII

In reason things are even simpler. Just copy and paste the “VRI StompIR Pack2” to the folder you place your Refills from the pack folder:

Then just navigate to the your folder within the reason's browser and choose the “VRI StompIR Pack2” Refill:

and drag your favorite RV-7000 MkII preset in it and it's done.

Thank you so much for purchasing our IR collection, we really hope you will enjoy it and you'll be using it for your next hit that will make you rich and famous!
