

NATURALISER 2

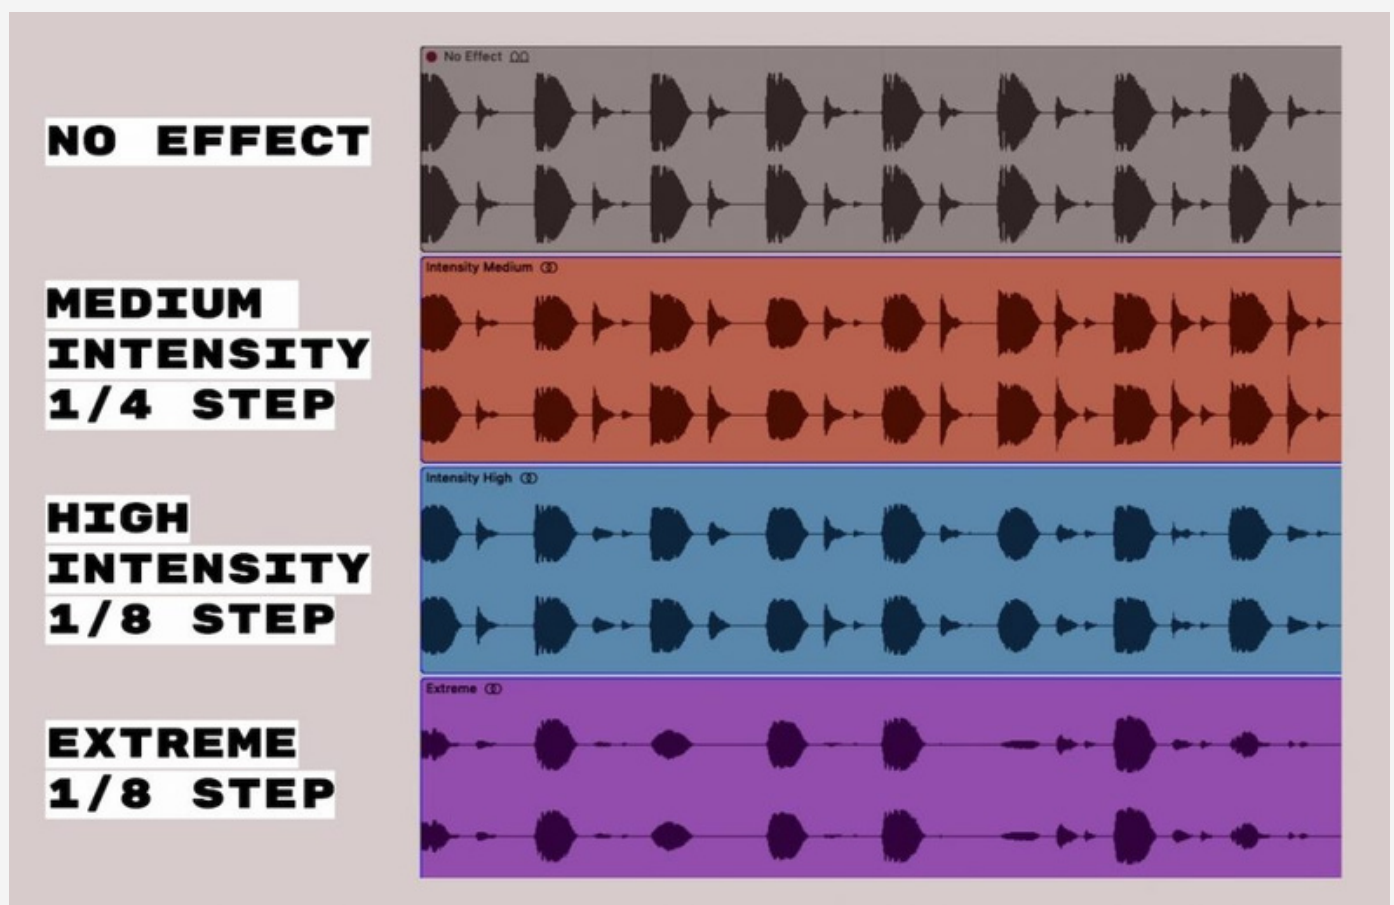

USER MANUAL

OVERVIEW

Working through spectral, transient and colouring dimensions, Naturaliser creates an audio output that changes forever.

Naturaliser is an effect plugin that will introduce a strong depth of micro variety over time onto the incoming audio and the effect can also be taken to extremes. You can see how different intensities create variety in the waveform below.

MusicTech

"Make your music less robotic with Naturaliser. Music often sounds better when there's variation. Rast Sound's plug-in applies that concept effortlessly."

ENGINE EXPLANATION

A. The animation layer shows each 3 effect dimensions in action, their speed and even their intensity.

A2. With new Smooth control, determine how transitions between effect states behave.

- Low Smooth → changes feel stepped, like cuts between states.
- High Smooth → transitions evolve gradually, ideal for pads, synths, and vocals.

B. Through the upper panel knobs, you can arrange the intensity of each effect dimension for spectral, transient and colour layers. This gives control over how much each effect will be mixed into the general intensity.

C. General intensity of the effects all combined, increase the percentage for Naturaliser to kick in more.

D. Swing adds groove by offsetting the timing of steps for a more human, rhythmic feel.

E Noise section introduces moving noise elements that blend into the signal, adding organic texture. Choose from Pink, White, or Velvet, each with distinct tonal color. Filter shapes the tonal balance of the noise and variation effect, letting you emphasize or soften certain frequencies. Noise only triggers when audio is present, keeping silent passages clean.

F. Free / Sync / Adaptive

- Free → Run variation at a free-running speed.
- Sync → Lock timing to your project's tempo.
- Adaptive → Variation responds dynamically to the input signal, adapting timing and feel in real time.

G. Strength scales the effect intensity with precision, replacing the old Extreme Mode. Strength can now push the effect up to 5×, from subtle realism to bold sound-design movement.

H. Speed knob controls how fast the effect steps or evolves. It turns into a threshold for detect mode when switched.

REQUIREMENTS

- >> AU, AAX and VST3 formats available
- >> MAC including Apple Silicon (10.13 or higher) & WIN 10/11
- >> 4GB or higher ram recommended
- >> 64 bit versions only
