

CHROMA BOX

SPECTRUM EXCITER

Color Box is a spectrum exciter, designed to enhance your sounds with colorful saturation. Choose from the pallet of 32 color profiles then tweak to perfection with a few easy-to-use controls. In seconds it can bring a boring sound to life adding exciting and colorful character. Further 3D enhancement can be made with the Space and Resonate controls, adding depth and stereo width.

The Depth knob scales the entire effect with a single control, while Hue, Saturation and Luminance shape the color profile. The pallet of 32 color profiles has been carefully designed and tested on a huge range of sounds, making it sound great on any element in a mix.

Depth controls the total amount of effect. When this control is at 0% all other controls will have no effect.

Type selects the color profile.

Hue controls the shifting of the color profile in the frequency spectrum.

Saturation controls the magnitude of the color profile, generating additional harmonics.

Luminance controls the balance between low and high frequency content.

Space controls the amount of reflections, simulating a small 3D space. The character is dependent on the selected color profile.

Resonate controls the level of resonant peaks, that can ring out. The character is dependent on the selected color profile.
